About Zearn

Numeracy is one of the best predictors of a student's success. Yet, it is also an area where American children are falling behind. In 2012, Zearn was founded as a nonprofit in response to this challenge, to help every child learn and love math. To do this, [Zearn](#) built an online program — Zearn Math — with lessons covering kindergarten through eighth-grade math concepts designed to help teachers ensure every student can succeed in grade-level math.

As a nonprofit, Zearn is motivated by impact, not dollars, which is why all math lessons – including more than 500 hours of interactive digital lessons – are free to [all kids, teachers and families](#). Zearn also supports states, districts and schools — including public, private, charter, religious and home schools — to drive programmatic adoption.

About Zearn Math

Zearn Math is an online program that ensures students learn and practice math every day to build fluency and conceptual understanding. Each lesson begins with fluency games to reinforce essential skills followed by a video lesson featuring on-screen teachers who introduce new concepts visually — like slicing oranges to explore fractions. Throughout the lesson, students solve problems on-screen and on paper.

If a student gets stuck, the lesson adapts in real time to provide targeted support. Each lesson concludes with a mastery quiz that students must complete with a perfect score before moving on.

Zearn Math is designed for flexible implementation and can be used during core instruction, high-impact tutoring, summer learning, intervention time or at home. Over the past 13 years, it has been field-tested and developed by teachers, continuously improving with direct feedback from educators and students.

Key stats

- Used by 1 in 4 elementary school students, 1.4 million middle school students in all 50 states
 - 63% schools served are Title I schools*
- Used by more than 245,000 families nationwide
- 90% of teachers said they would recommend Zearn to another teacher (2023 survey)
- More than 17 billion math problems on Zearn Math

**Title I schools serve a high percentage of students from economically disadvantaged families.*

Impact on math learning

As a nonprofit, Zearn is committed to sharing data insights to support the pursuit of numeracy for all. Research collaborations extend across Every Student Succeeds Act evidence tiers and include large-scale randomized controlled trials and quasi-experimental design studies.

Zearn also partners with state and districts to [study the impact](#) of consistent Zearn Math usage — three or more lessons per week — on state and interim assessments. Positive and statistically significant outcomes have been consistently observed for both elementary and middle school students who use Zearn Math digital lessons regularly. These effects hold true across different starting proficiency levels and among student groups, including Black and Latino students, economically disadvantaged students and English learners.
